

Electrospinning has attracted increasing interest as a promising technology to fabricate nanostructured materials with manifold applications in different industrial fields.

The Research Group on Electrospinning (RGE) at University of Bologna has an interdisciplinary nature and arises from the common desire of the partners to gather their knowledge to study and further develop this technology platform.

RGE intends to be a network research center dedicated to investigate on electrospinning. RGE proposes itself as an international reference center through:

- Integrated interdisciplinary research
- Creation of a relationship with the productive world
- Spread research outcomes to the economical-productive system and to the society
